

Take-Home Assignment

Conversational Search for Copart

Build a conversational search experience for Copart that allows a user to search and refine vehicle inventory using natural language.

The experience should support realistic multi-turn conversations where the user's requirements can change or become more specific over time.

What to Build

Create a working prototype that demonstrates the experience end-to-end using a vehicle inventory/search capability of your choice.

You are free to choose the technologies, models, frameworks, architecture, and infrastructure.

What to Submit

- Working application or runnable prototype
- Short README with setup and usage instructions
- Brief architecture overview and explanation of your key decisions

Considerations

Think about what would be required for this to become a production-facing capability. You should be prepared to discuss the decisions you made and how your solution would evolve as usage and inventory grow.

Time

Target approximately 6–8 hours. Prioritize the quality of the solution and your engineering decisions over UI polish.

Important: There is no prescribed architecture or technology stack. We are interested in how you approach the problem.
